

## CARDINALITY OF SETS

### Definitions – MTH110 Review

- Let A and B be any sets. A has the same **cardinality** as B, if and only if there is a bijection from A and B or from B to A.
- A set is called **finite** if, and only if, it is the empty set or there is a bijection from  $\{1, 2, \dots, n\}$  to it, where n is a positive integer. In the first case, the **number of elements** in the set is said to be 0 and in the second case it is said to be n. The number of elements of a finite set A is denoted  $N(A)$ .
- A set that not finite is called **infinite**.

### Properties

- Addition Rule: If  $\{A_1, A_2, \dots, A_n\}$  is a partition of a finite set A, then
 
$$N(A) = \sum_{i=1}^n N(A_i)$$
- Difference Rule: If A is a finite set and  $B \subseteq A$ , then
 
$$N(A-B) = N(A) - N(B)$$
- Inclusion/Exclusion Rule: If A and B are any finite sets, then
 
$$N(A \cup B) = N(A) + N(B) - N(A \cap B)$$

## COUNTING AND FUNCTIONS

### Pigeonhole Principle

A function from one finite set to a smaller finite set cannot be one-to-one: There must be at least 2 elements in the domain that have the same image in the co-domain.

### Generalized Pigeonhole Principle

For any function f from a finite set X to a finite set Y, and for any positive integer k,

if  $N(X) > k \cdot N(Y)$ ,

then  $\exists y \in Y$  s.t. y is the image of at least  $k+1$  distinct elements of X.

## MULTIPLICATION RULE

If an operation consists of k steps

and for any i from 1 to k, the  $i^{\text{th}}$  step can be performed in  $n_i$  ways,

then the whole operation can be performed in  $\prod_{i=1}^k n_i$  ways.

## PERMUTATIONS AND COMBINATIONS

### Permutations

- For any integer  $n \geq 1$ , the number of permutations of a set with  $n$  elements is  $n!$
- An **r-permutation** of a set of  $n$  elements is an ordered selection of  $r$  elements taken from the set of  $n$  elements. The number of  $r$ -permutations of a set of  $n$  elements is denoted  $P(n,r) = \frac{n!}{(n-r)!}$

### Combinations

Let  $n$  and  $r$  be non-negative integers with  $r \leq n$ .

- An **r-combination** of a set of  $n$  elements is a subset of  $r$  of the  $n$  elements. The symbol  $\binom{n}{r}$  which is read “**n choose r**” denotes the number of subsets of size  $r$  ( $r$ -combinations) that can be chosen from a set of  $n$  elements.
- $\binom{n}{r} = \frac{P(n,r)}{r!} = \frac{n!}{r!(n-r)!}$

### Permutations of a set with repeated elements

- If a collection consists of  $n$  objects grouped into  $k$  categories such that all the objects in the same category are indistinguishable from each other and the  $i^{\text{th}}$  category has  $n_i$  elements. Then the number of distinct permutations of the  $n$  objects is

$$\binom{n}{n_1} \binom{n-n_1}{n_2} \binom{n-n_1-n_2}{n_3} \cdots \binom{n-n_1-n_2-\cdots-n_{k-1}}{n_k} = \frac{n!}{n_1!n_2!\cdots n_k!}$$

### Combinations with repetitions allowed

- An **r-combination with repetition allowed**, or **multiset of size r**, chosen from a set  $X = \{x_1, \dots, x_n\}$  of  $n$  elements is an unordered selection of elements taken from  $X$  with repetition allowed. This is denoted by  $[x_{i1}, \dots, x_{ir}]$  where each  $x_{ij}$  is in  $X$  and some of the  $x_{ij}$  may equal each other.
- The number of multisets of size  $r$  selected from a set of  $n$  elements is  $\binom{r+n-1}{r}$

**PROPERTIES OF COMBINATIONS**

- For any positive integer  $n$ :  $\binom{n}{n} = 1$  and  $\binom{n}{1} = \binom{n}{n-1} = n$

Combination of Complement

- Let  $n$  and  $r$  be non-negative integers with  $r \leq n$ . Then  $\binom{n}{r} = \binom{n}{n-r}$

Pascal's Formula:

- $\binom{n+1}{r} = \binom{n}{r-1} + \binom{n}{r}$

Binomial Theorem

- Given any real numbers  $a$  and  $b$  and any non-negative integer  $n$ ,

$$(a+b)^n = \sum_{k=0}^n \binom{n}{k} a^{n-k} b^k$$
